-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 25 April 2005.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1,2,7,8,10 and 23-36 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1,2,7,8,10, 23-25, 27-30, 32-33, and 35 is/are rejected.
- 7) ☒ Claim(s) 26,31,34 and 36 is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- \* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449 or PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: \_\_\_\_\_

DETAILED ACTION

1. This communication is responsive to Amendment filed 04/25/2005.
2. Claims 1-2, 7-8, 10, and 23-36 are pending in this application. Claims 1, 7, and 35 are independent claims. In Amendment, claims are cancelled and claims are added. This Office Action is made non-final after a RCE filed 04/25/2005.

*Claim Rejections - 35 USC § 103*

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1, 7-8, 23-25, 27-30, 32-33, and 35 are rejected under 35 U.S.C. 103(a) as being obvious over Knowles (U.S. 6,446,107) in view of Taewhan et al. ("Arithmetic Optimization using Carry-Save-Adders").

Re claim 1, Knowles discloses in Figure 3 an apparatus (e.g. abstract and col. 9 line 59 – col. 10 line 10) for performing addition of propagate, kill, and generate recoded numbers (e.g. each pair of bits in Figure 3 are encoded as PKG for OR, AND, and XOR logic gate respectively), apparatus comprising: circuitry (e.g. circuitry in Figure 3, for now the top portion of Figure 3 will be used for illustrating) configured to receive at least a first operand (e.g. PKG of a0 and b0), a second operand (e.g. PKG of a1 and b1), and a

carry-in bit (e.g.  $C_0$  input goes into dash-line box 26), the first and second operands comprising respective first and second propagate, kill, and generate recoded number representations of respective first and second binary operands (e.g. output of  $6_0$  as kill, output of  $2_0$  as generate, output of XOR as propagate; similarly for  $a_1$  and  $b_1$ ); a first adder (e.g. a mid portion of Figure 3 including  $8_0$ ,  $10_0$ ,  $8_1$  logic gate and attached XOR gate which interfaces with all p, k, and g of  $a_0$ - $a_1$  and  $b_0$ - $b_1$ ) configured to add first operand (e.g. representations of  $a_0$  and  $b_0$ ) and second operand (e.g. representation of  $a_1$  and  $b_1$ ) to generate a third propagate, kill, and generate recoded number representation (e.g. outputs go to  $24_0$  and  $24_1$  logic gates) and a carry-out bit (e.g. output of second level OR next to  $8_1$  AND gate which carry to the next bit); and a modified adder (e.g. last portion of Figure 3 including  $24_0$ , and  $24_1$ ) configured to receive the third propagate, kill, and generate recoded number representation from the first adder (e.g. all inputs go to  $24_0$  and  $24_1$  logic gates), and the carry-in bit from the circuitry (e.g.  $C_0$  goes into  $24_0$  logic gate), add the separate propagate, kill, and generate bits of the third propagate, kill, and generate recoded number representation with the carry-in bit to generate a sum value (e.g.  $S_0$ ,  $S_0'$  by the first XOR logic gate  $24_0$ ) and a carry value (e.g. output of  $10_0$  to the next bit or  $S_1, S_1'$ ) wherein the circuitry provides the carry-out bit from the first carry-save adder at a first output (e.g. output of OR gate attached to  $8_1$  logic gate) and the carry value from the modified adder at a second output (e.g. Figure 3), wherein each of the propagates, kill, and generate recoded number representations has a respective kill bit, a respective propagate bit, and a respective generate bit that are indicative of a respective coded logical value having a plurality of bits (e.g. col. 9 line 59 – col. 10 line 10),

wherein the kill bit, if at a particular binary value (e.g.  $k = a + b$  in line 66 col. 9 wherein the kill goes low or 0 only if  $a$  and  $b$  is zero), indicates that each of the bits of the respective coded logical value is not sets wherein the propagate bit, if at the particular binary value (e.g.  $p = a \text{ exor } b$  in line 65 col. 9 wherein the propagate bit goes high or 1 only if either  $a$  or  $b$  is high), indicates that only one of the bits of the respective coded logical value is sets and wherein the generate bit, if at the particular binary value (e.g.  $g = a * b$  in line 64 col. 9 wherein the generate bit goes high or 1 only if both  $a$  and  $b$  are high), indicates that two of the bits of the respective coded logical value are set. Knowles fails to disclose the first and modified adder is the carry-save adder. However, Taewhan et al. disclose the carry-save adder is the most often used type in implementing a fast computation of arithmetic in industry (e.g. abstract). Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention is made to add the carry-save adder as seen in Taewhan et al.'s invention into the first and modified adder in Knowles' invention because it would enable to compute addition faster in hardware implementation (e.g. abstract and first paragraph under introduction section).

Re claim 7, it is a method claim of claim 1. Thus, claim 7 is also rejected under the same rationale as cited in the rejection of rejected claim 1.

Re claim 8, Knowles further discloses in Figure 3 logically combining comprises adding the third propagate, kill, and generate representation and the carry-in value (e.g. 24<sub>0</sub>, and 24<sub>1</sub> logic gates).

Re claim 23, Knowles further discloses in Figure 3 the sum value is a function of the third propagate representation and the carry-in value (e.g.  $24_0$  wherein it takes the value of  $C_0$  as carry-in and output of EXOR gate as the third propagate representation).

Re claim 24, Knowles further discloses in Figure 3 the sum value is the XOR combination of the third propagate representation and the carry-in value (e.g.  $24_0$  is the XOR logic gate).

Re claim 25, Knowles further discloses in Figure 3 the carry value is a function of the third propagate representation, the carry-in value, and the third generate representation (e.g.  $24_1$  including output of XOR gate  $10_0$  and output of XOR gate).

Re claim 27, Knowles further discloses in Figure 3 the carry-out value is a function of the first and second generate representations (e.g. output of OR gate adjacent to  $8_1$ ).

Re claim 28, Knowles further discloses in Figure 3 the carry-out value is the OR combination of the first and second generate representations (e.g. output of OR gate adjacent to  $8_1$  indirectly).

Re claim 29, Knowles further discloses in Figure 3 the circuitry provides the sum value at a third output (e.g.  $24_0$ ).

Re claim 30, Knowles further discloses in Figure 3 logically combining comprises a XOR combination of the third propagate representation and the carry-in value (e.g.  $24_0$ ).

Re claim 32, Knowles further discloses in Figure 3 step of generating comprises an OR combination of the first and second generate representations (e.g. output of OR gate adjacent to  $8_1$  indirectly).

Re claim 33, Knowles further discloses in Figure 3 only one of the kill, propagate, and generate bits of each possible propagate, kill, and generate recoded number representation can simultaneously be at the particular binary value (e.g. col. 9 line 59 – col. 10 line 10).

Re claim 35, Knowles discloses in Figure 3 apparatus (e.g. abstract and col. 9 line 59 – col. 10 line 10) for performing addition, apparatus comprising: circuitry (e.g. circuitry in Figure 3, for now the top portion of Figure 3 will be used for illustration) configured to receive an operand defining a logical value encoded in propagate, kill, and generate (PKG) form such that the operand has a propagate bit, a generate bit, and a kill bit (e.g. PKG of  $a_0$  and  $b_0...$ ), wherein the logical value, when decoded into a non-PKG form, has a plurality of bits (e.g. col. 9 line 59 – col. 10 line 10), wherein the kill bit, if at a particular binary value (e.g.  $k = a + b$  in line 66 col. 9 wherein the kill goes low or 0 only if  $a$  and  $b$  is zero), indicates that none of the bits of the logical value are set, wherein the propagate bit, if at the particular binary value (e.g.  $p = a \oplus b$  in line 65 col. 9 wherein the propagate bit goes high or 1 only if either  $a$  or  $b$  is high), indicates that only one of the bits of the logical value is set, and wherein the generate bit, if at the particular binary value (e.g.  $g = a * b$  in line 64 col. 9 wherein the generate bit goes high or 1 only if both  $a$  and  $b$  are high), indicates that two bits of the logical value are set; and an adder configured to add the operand in PKG form to a carry bit without decoding the operand

from PKG form (e.g. Figure 3). Knowles fails to disclose the adder is the carry-save adder. However, Taewhan et al. disclose the carry-save adder is the most often used type in implementing a fast computation of arithmetic in industry (e.g. abstract). Therefore, it would have been obvious to a person having ordinary skill in the art at the time the invention is made to add the carry-save adder as seen in Taewhan et al.'s invention into the adder in Knowles' invention because it would enable to compute addition faster in hardware implementation (e.g. abstract and first paragraph under introduction section).

5. Claims 2 and 10 are rejected under 35 U.S.C. 103(a) as being obvious over Knowles (U.S. 6,446,107) in view of Taewhan et al. ("Arithmetic Optimization using Carry-Save-Adders"), as applied to claims 1 and 7 respectively above, and further in view of Miller (U.S. 5,706,323).

Re claim 2, Knowles in view of Taewhan et al. do not disclose sum value and carry value are dual rail encoded values. However, Miller discloses a method of encoding variables into dual rail values in Figure 3. Therefore, it would have been obvious to a person having ordinary skill in the art to encode the sum value and carry value as dual rail values as seen in Miller's invention into Knowles in view of Taewhan et al.'s invention because it would simplify the circuitry and reduce the noise.

Re claim 10, it is a method claim of claim 2. Thus, claim 10 is also rejected under the same rationale as cited in the rejection of rejected claim 2.

*Allowable Subject Matter*

6. Claims 26, 31, 34, and 36 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

*Response to Arguments*

7. Applicant's arguments with respect to claims 1-2, 7-8, 10, 23-25, 27-30, 32-33, 35 have been considered but are moot in view of the new ground(s) of rejection.

*Conclusion*

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- a. U.S. Patent No. 6,131,107 to Wolrich et al. disclose a fast determination of carry inputs from lower order product fro radix-8 odd/even multiplier array.
- b. U.S. Patent No. 5,285,406 to Lynch et al. disclose a high speed mixed radix adder.
